After the Save, Nothing Happens - And that is where the purchase is lost

Myntra

BUSINESS METRIC - % of **users** who purchase at least one wishlisted item within 30 days of adding it.

WHY THIS METRIC?

Saved items are demand already paid for — no CAC. And a purchase made *after* their doubts are answered is a purchase less likely to come back as a return. This metric buys volume and quality at once.

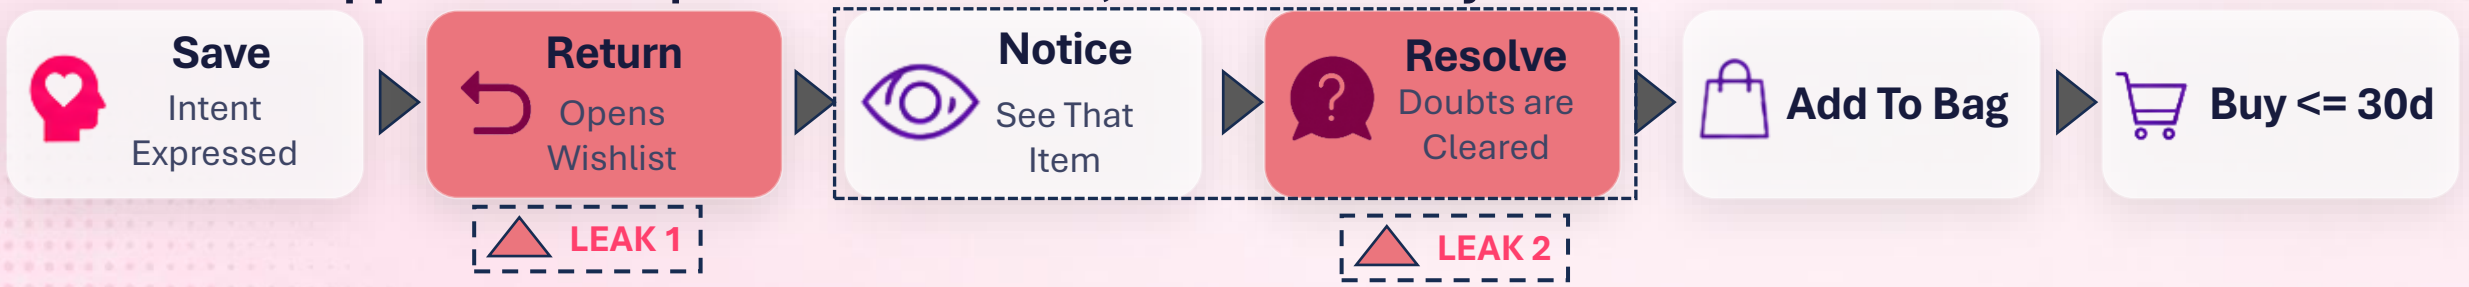

WHY WAITING COSTS THE SALE?

"In stock" isn't enough - it has to be in your size, and most styles never come back

THE CONSTRAINT

No Monetary Incentives - Coupons, Discounts and price drops are off the table

What has to happen - four steps we can measure, two we can only infer.

LEAK 1 : EVERY NUDGE IS URGENCY

Two alerts exist on a saved item: price drop and low stock. Both say hurry.

Neither says anything new about the item itself - and most items trigger neither.

LEAK 2 : NO NEW ANSWER

Those who return meet the same photo, size chart and reviews. Nothing has been added since they saved.

So whatever stopped them the first time stops them again.

USERS, NOT ITEMS

The metric tracks users who buy at least one saved item, not what share of saved items convert.
So, unblock each user's highest-intent item - not bulk cleanup.

Two leaks suggest a common mechanism: unresolved uncertainty.

AI DISCOVERY ENGINE · HOW IT WORKS

LINK – DISCOVERY ENGINE

Why people save and why they don't buy are two different questions and two different fields

15,661
Reviews Collected

2 Tags &**11**
Bucket classification

App Store
Total **4,451** Collected

Play Store
Total **7,449** Collected

You Tube
Total **3,761** Collected

1 COLLECT

Play Store, App Store, YouTube. **15,661** public reviews and comments about Myntra.

2 SCREEN

Every item read and judged for Wishlist relevance. **1,505** qualify - 9 in 10 of the total complaints concern delivery, app bugs or other issues.

3 TAG

Two tags per item: **why it was saved, and what blocks it now.** Categorized into Eleven buckets each.

4 QUANTIFY

Both fields counted as share of mentions, so save motives and current blockers can be compared directly.

5 RANK

Ranked by gap: blockers outweighing save intent signal post-save problems.

THE DESIGN CHOICE

Every item was tagged twice, **why it was saved** and **what blocks it now**. Different questions, often different answers — somebody saves to compare, then it sells out. The gap between the two fields is the finding on the next slide. A single-field taxonomy could not produce it.

WHAT THE NUMBERS SURVIVED

Taxonomy v0→v1. A first pass left 32% unclassified. That bucket contained generic app complaints passing the relevance filter; a tightened re-run brought it to 9.3%.

Model isolation. Groq tagged unreliably. The same items re-run on **Gemini** showed the shift was the model, not the data.

Verification. Every extracted row was checked for correct bucket assignment; confidence is recorded per row, so low-confidence tags are reportable rather than hidden.

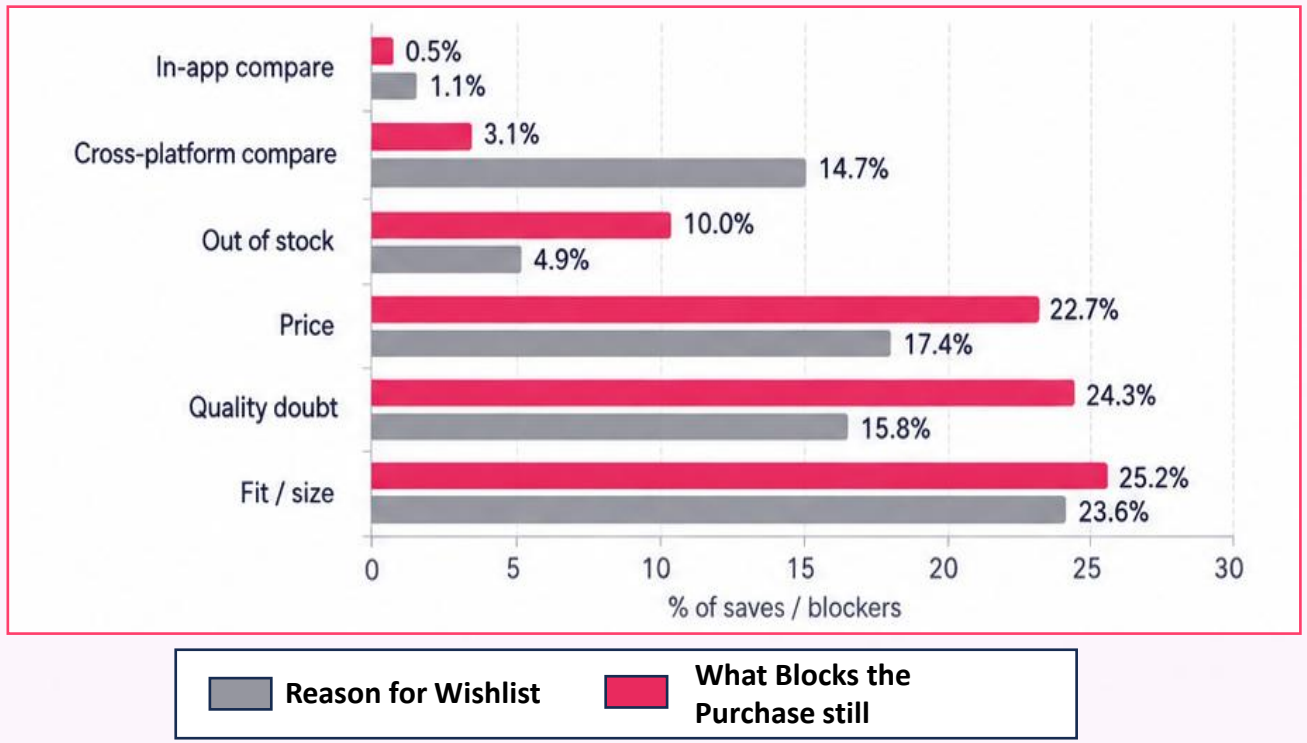

Not a summarizer. The output is a ranked, quantified opportunity table — corrected twice before it was used.

DISCOVERY ENGINE FINDINGS – N=1,505 LINK – DISCOVERY ENGINE

Myntra

Comparison sorts itself out. Fit doubt doesn't - and the item sells out while you decide

Why People Save And What Blocks Them From Purchasing

Reading the two columns together: Every bucket that grows from motive to blocker is a question nobody answered; every bucket that shrinks is one that answered itself.

Comparison resolves itself

Cross-platform comparison falls from 14.7% of save motives to 3.1% of live blockers — a 5× drop. People who save to compare do eventually decide.

Fit doubt does not resolve

Top save motive (23.6%) and top current blocker (25.2%). Nothing between saving and buying answers it.

Stockout is an outcome, not a motive

Doubles from 4.9% to 10.0%. Some people do save out-of-stock items to be alerted — but most users lose the item while deliberating.

Price is real but out of scope

22.7% of blockers. Measured, not solved: the brief rules out monetary incentives.

Delay is the mechanism. The next question is who it happens to.

TARGET SEGMENT · HOW IT WAS NARROWED SURVEY N=47 LINK – Survey Results

Myntra

Everyone has the same blockers. This segment is still trying to buy.

A HOW WE FOUND THE SEGMENT

1. **Not assumed at the start**
   Corpus splits came first — gender, category, price tier, platform. None of them explained the behavior.

2. **Life stage + Age move together**
   18 of the 23 respondents aged 25–30 live with family.

3. **The survey showed who acts**
   Same blockers as everyone, but nine engagement measures separate them — the users most likely to act on an answer.

Life stage, not age.
Age predicts little. We selected this segment for its high Wishlist engagement, purchase intent, persistent fit uncertainty, and frequent stockout after delay. Living with family suggests the primary constraint is confidence, not affordability.

B THE SEGMENT

Working, 25-30, living with family

Mixed Western and Occasion wear

14 of 18 save at ₹800–₹3,000

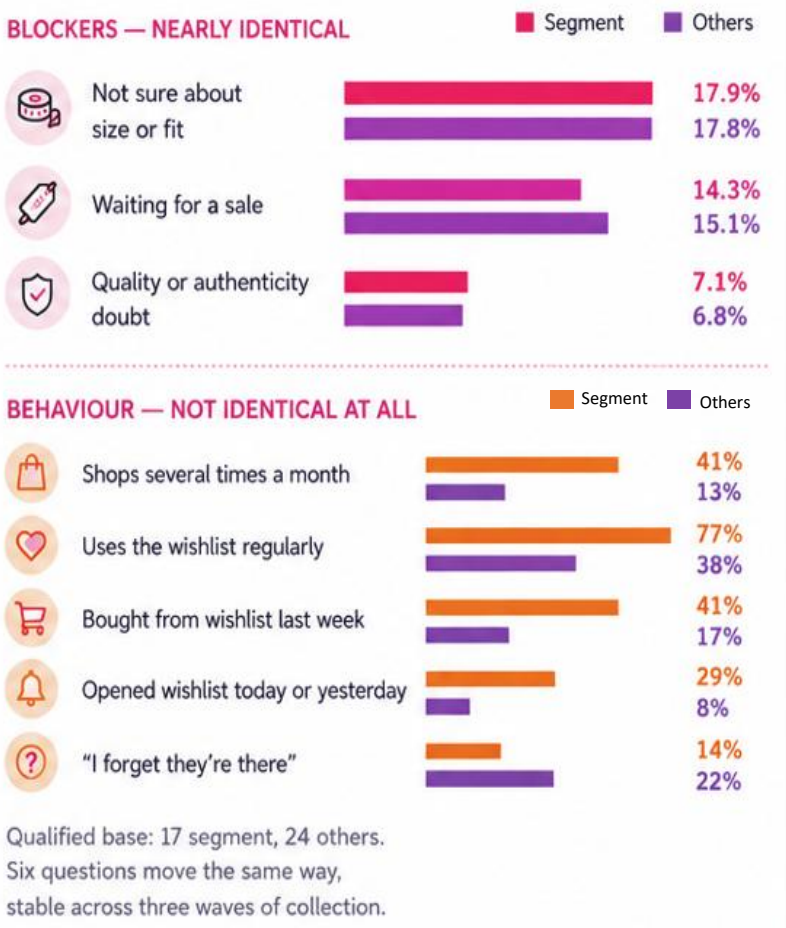

Saves few items, not dozens

18/47 fit the segment

16/18 have lost an item to a stockout - none said never

19% want fit judged against something they already own

C SAME BLOCKERS, DIFFERENT INTENT

Qualified base: 17 segment, 24 others. Six questions move the same way, stable across three waves of collection.

Same problem as everyone. These are the users most likely to do something about it.

PRIMARY RESEARCH · SURVEY N=47 · INTERVIEWS N=7 LINK – Survey Results LINK – User Interviews

Nobody was waiting for a better item. They were waiting for a reason to decide.

THREE METHODS, ONE TAXONOMY

BLOCKER	CORPUS	SURVEY	INTERVIEWS	INSIGHT
Fit / size	25.2%	19%	5 of 7	Top in all three
Waiting for a sale	22.7%	14.7%	5 of 7	—
Quality doubt	24.3%	7.0%	1 of 7	Corpus 3.5x
Compare on the app	0.5%	14.7%	4 of 7	Corpus blind
Occasion pending	0.9%	9.3%	1 of 7	Corpus blind

Fit ranks first in all three methods, arrived at independently — that agreement is the validation, not any single number.

WHY THE METHODS DISAGREE

Public complaint corpora over-report grievance and are blind to passive deliberation. Nobody writes a review saying they are comparing three kurtas or waiting for a November wedding — there is no grievance to post.

Negative finding: delivery and returns dominate raw app-store reviews but account for 1.6% of wishlist blockers. The loudest complaint is not the relevant one.

Pre-registered hypothesis, corrected: delivery trouble does slow purchase — via anticipated return effort, not delivery itself.

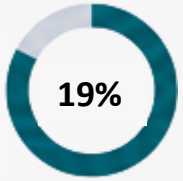

The Chain Confirmed in 5 of the 7 interviews

Size question unanswered ▶ Delay ▶ Sells- Out ▶ Settles for Less

> *I checked the size chart but it didn't really help. The reviews were mixed — some said true to size, some said smaller – P7*

38 of 47 have lost an item this way, yet only 3.9% name stockout as today's blocker. It is an outcome, not a reason.

WHAT THEY SAY WOULD ACTUALLY WORK

Asked unprompted what would help most, 19% chose knowing the exact fit from something they already own.

"If I knew M would fit me, I'd probably buy it right now." P7

"Honestly, someone telling me which one to pick." P5

THE CORRECTION THAT CHANGED THE PROJECT -

"Waiting for a sale" is two problems, not one(Second highest issue discovered)-

1)Price-uncertain — would pay today, waiting only to see if it drops. Solvable with information.

2)Price-constrained — will not pay. Not solvable without money; excluded by choice.

The engine found the pattern. The interviews corrected it — splitting the price bucket into one part information can solve and one part it cannot.

Myntra

The size chart describes the garment. Nothing tells me whether it fits me.

> *"I've found something I want. I can't tell whether it will fit **me**. The chart describes the garment, not my body, and the reviews were written by people I know nothing about. So I put it off — and when I come back my size is gone and I settle for something I like less."*

FIVE WHYS
FROM SYMPTOM TO ROOT CAUSE

I saved something I want, and I still have not bought it.

WHY 1	Because I cannot tell which size will fit me.
WHY 2	Because the chart describes the garment and the reviews describe strangers.
WHY 3	Because no fit information is connected to my body or my history.
WHY 4	Because the answer Myntra can give sits on the product page, collapsed behind a tap, on about a fifth of the catalogue.
WHY 5	Because fit help is built as a product-page feature, not as something that reaches the decision I actually deferred.

ROOT CAUSE **So, I have to guess. Guessing risks a return, a return is effort, and postponing costs nothing today — deferring is the rational choice.**

Three tools exist. None of them answers the question at the moment it's asked.

- **Size chart —** *"I checked it, but it didn't really help." P7*
- **Reviews —** *"Mixed. Some said true to size, some said smaller." P7*
- **Myntra's size suggestion —** on ~20% of items, mostly shirts and trousers from large brand. The reason appears only if you tap "Why 40/38 for me?"

Four price signals show without a tap; the fit reason needs one. The answer exists — just not where the decision stalls.

WORK AROUND USERS BUILT

- Orders 2 sizes, return 1
- Check the brand's own site
- Ask a Friend

"I don't buy either" – P1

WHAT THEY CANNOT DO

They can save. They cannot tell, from the Wishlist, whether the item still fits them or is still there — so they cannot close it

THE PROBLEM, STATED - **Working 25–30s living with family** return more than anyone, but the answer is often absent — so the item sells out.
Outcome to move fewer days between saving and buying.

User: gets the item they wanted, not a replacement. Myntra: demand that already exists, lost to deliberation rather than price.

COMPETITIVE POSITION · SOLUTION RATIONALE

The fit answer exists. It just never reaches the Wishlist.

WISHLIST CAPABILITY • WHAT EACH APP ACTUALLY DOES

CAPABILITY	Myntra	AJIO	Amazon	Nykaa
A wishlist exists	✓	✓	✓	✓
A size chart	✓	✓	✓	✓
Size suggested from your own history (i)	✓	✗	✗	✗
That reason shown without a tap	✗	—	—	—
Any of it inside the wishlist	✗	✗	✗	✗
Stock in your size, or what changed	✗	✗	✗	✗

(i) Shown on roughly 20% of items — mostly shirts and trousers from large brands. Checked on the Indian apps.

THE ADVANTAGE — Myntra sees more of one wardrobe than anyone, plus its own price and stock truth. But no one has put any of it where the decision stalls. Kept **and returned** history, real stock, true price history.

WHY THESE USERS ARE ON MYNTRA AT ALL

Widest brand range, ethnic and western in one place.
14.7% save items to compare against other apps — but only **3.1%** still say comparison is what's stopping them. The shopping-around gets settled, and it settles on them buying in Myntra.(Data from discovery engine)(Slide – 3).

Choosing the platform isn't the problem. Choosing the item is.

THREE PRINCIPLES, EACH FROM A FINDING

Show a verdict, not data
P4 -"More information makes it worse you notice differences you didn't care about."

One item, not forty
The metric counts users, not items.
P5: "someone telling me which one to pick."

Anchor to something they own
"Fits like the Roadster L you kept." 19% asked for this, unprompted.

CONSIDERED AND REJECTED

PRICE DROP ALERTS
Three of seven said Myntra's discount cadence taught them to wait. Myntra already ships alerts. The inverse is used: "lowest in 90 days."

BODY MEASUREMENT
Not buildable credibly, and it outputs numbers — inviting the deliberation that makes decisions worse.

3D OR VIRTUAL TRY-ON
Pictures were never the gap. "The pictures tell me what it looks like, not whether it will fit me." P4

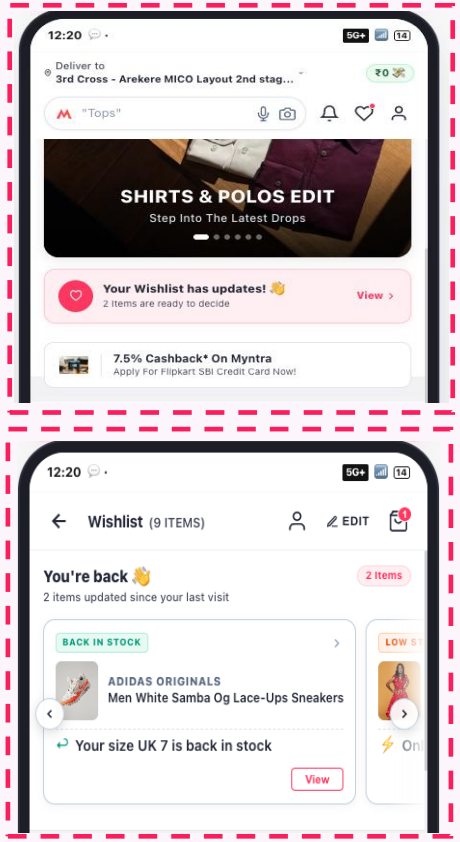

REVIEW SUMMARIES
Reviews already failed these users — contradictory, and none written by anyone like them.

THE MVP · DEPLOYED AND TESTABLE [LINK – MVP]

We don’t sort your saved items. We tell you which one to buy today.

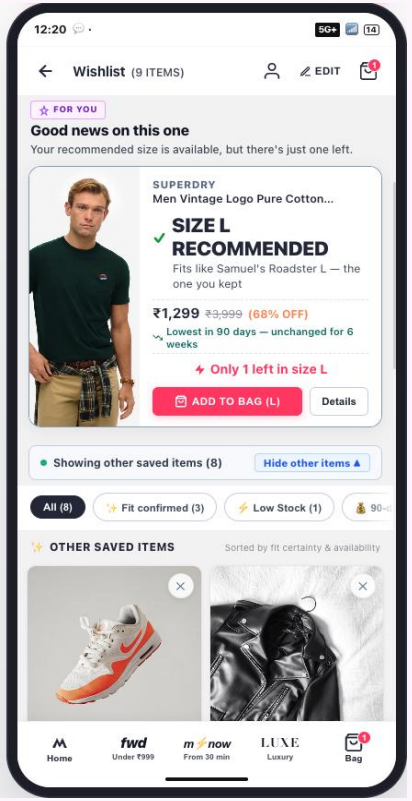

Myntra

1 · A reason to return

A home-feed card fires when saved items become decidable — not when the price moved. Tapping through opens the Wishlist on what actually changed.

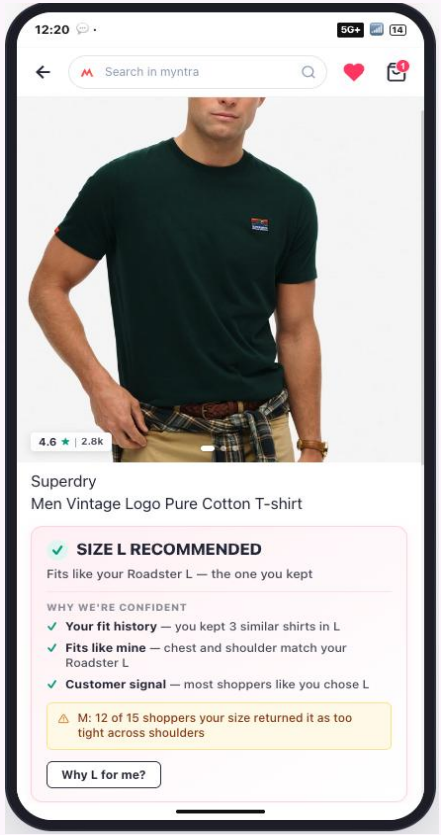

2 · The verdict, in-list

Of all the saved items, one is decidable today: It takes the first screen; the other items sit below it.

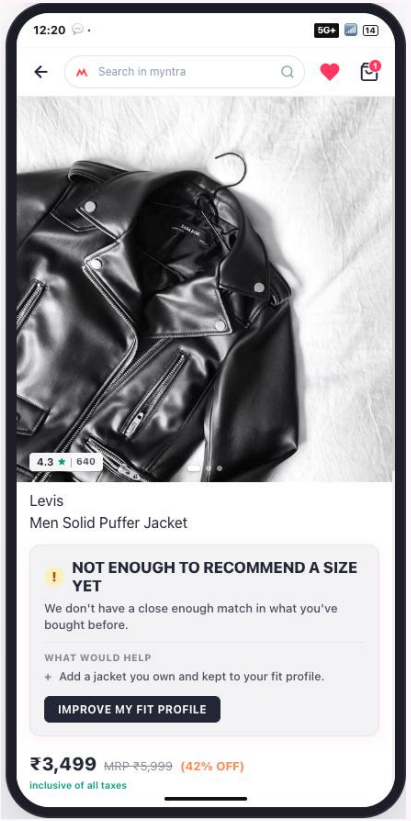

Hero rank: fit confidence × intent × urgency. No confident verdict, no hero.

3 · Same answer, no tap

"Myntra already shows a size recommendation, with the reason behind a tap. Here the reason is the answer, and it sits above the offers.

4 · It declines to guess

With no comparable garment it says so and asks for input rather than inventing an answer.

WHAT THIS ADDS TO WHAT MYNTRA SHIPS

Where

In the wishlist, where the decision was deferred — not on a page they already left.

What

Ranks the saved set and opens on the one item where a decision is possible today. The rest are still there, below it.

When

Tied to stock in that size and to price history, so the verdict has a deadline. Stock and price set the deadline, not the verdict.

THE VERDICT IS DETERMINISTIC

Rules, not a model: kept-garment similarity 40%, size behaviour 25%, garment measurements 20%, fit signals 15%.

An LLM writes the phrasing only, never the verdict. Fit decides the verdict. Stock and price only set the timing.

Prototype link in the header — no login, one click, reset button included.

SUCCESS METRICS

Myntra

If the mechanism is right, the time between saving and buying falls.

BUSINESS METRIC - % of users who buy at least one saved item within 30 days. Everything below is a link in the chain that produces it.

THE CHAIN, AND WHAT MEASURES EACH LINK

RETURN	**They come back to the Wishlist**	7-day revisit rate. The home-feed card fires on price and stock; this fires on resolution.
NOTICE	**The one decidable item surfaces**	Hero acceptance rate: share of sessions where the first action is on the hero, not the grid.
RESOLVE	**The doubt gets answered**	Verdict view rate, then verdict → add-to-bag by confidence tier. High must beat medium.
—	**The decision happens sooner**	Median days from save to purchase. The theory, not the outcome — the metric that can falsify it.
BUY <=30d	**More users buy one saved item**	The business metric. It can rise for reasons unrelated to the mechanism, so it is last.

GUARDRAILS · WHAT MUST NOT GET WORSE

Size-related return rate
Must fall, not merely hold. Any increase halts rollout.

Scarcity-signal accuracy
Of items flagged low-stock, the share that truly sold out within 14 days.

Wishlist save rate
If saving starts to feel like committing, users stop saving.

Notification opt-out rate
A trigger that fires without a real resolution is just another promotion.

Average order value
Catches a metric moved only by pushing cheap, low-risk items.

HOW IT WOULD SHIP · GATED

1 · SHADOW · 2 weeks
Verdicts computed on real wishlists, shown to nobody, checked against what each user later bought and kept.
Gate: agreement clears a pre-registered bar

2 · PILOT · 4 weeks
5% of the segment: A = Control , **B** = Wishlist verdict , **C** = B + Home-feed trigger.
Three arms, because two would show the bundle worked but not which half.
Gate: size-related return rate flat or falling

3 · EXPAND · 4 weeks
25% of the segment, randomised by user, cut by history depth — no anchor should mean no effect.
Gate: median days from save to purchase falls

4 · SCALE
National, plus a 90-day holdout separating real lift from purchases pulled forward.

Prediction: arm B carries most of the lift.

One metric tests the outcome; one tests the theory. If conversion rises but time-to-decision does not fall, the mechanism was wrong.

RISKS & MITIGATION

Myntra

The feature fails if it recommends confidently and wrongly.

	RISK	WHY IT MATTERS	MITIGATION
1	**Confident wrong size** Severity High	A confident wrong recommendation turns a non-purchase into a return, and kills trust in every later verdict.	Recommend only above the high threshold; medium softens to “likely fit”; below 60 recommends nothing. Size-related return rate is a hard guardrail — any increase halts rollout.
2	**No anchor where this segment saves** Severity High	The anchor needs a garment already bought and kept. Roughly 20% of items qualify — shirts and trousers from big brands, not the ethnic wear this segment saves.	The low-confidence state is built in: it declines and asks for one input. Where no anchor exists the card falls back to a timing verdict — stock and price — which needs no fit history. Coverage is reported, not assumed.
3	**The hero gets scrolled past** Severity Medium	Other saved items sit below the hero, not hidden. A user can scroll into the grid and resume comparing — the behaviour behind “I don’t buy either”.	Hero acceptance rate is the leading indicator that catches it. If most first actions land in the grid, the ranking is wrong or the hero is not persuasive — and the fix is the ranking, not more prominence.
4	**Purchases pulled forward, not created** Severity Medium	Conversion may rise because purchases that would have happened in week six now happen in week two. No incremental revenue.	A 90-day holdout comparing total purchases per user. If totals converge, the honest claim is “reduces stockout losses”, not “creates demand”. Both are real value; they are different claims.
5	**Scarcity signals lose credibility** Severity Medium	Users already disbelieve “only 2 left”. If it fires on items that then sit in stock it becomes noise. P4	Fires only on genuine size-level inventory and says plainly when nothing changed. Accuracy is instrumented as a guardrail — the no-change state is what keeps the positive signal believable.

Two risks could kill it, and both are named rather than hidden — the low-confidence state exists precisely because the anchor gap is real.
